The European Fuel Quality Directive[1] introduces a new market petrol across the European Union from 1st January 2011 that may contain up to 10% (by volume) ethanol (E10).

For vehicles equipped with a spark-ignition (petrol) engine introduced into the EU market, this list indicates their compatibility with E10 petrol which complies also with the EN 228: 2008[2] volatility limits.

### Other information:

The European Fuel Quality Directive requires that member states of the European Union must ensure that sufficient volumes of today's petrol are available for vehicles that are not compatible with the use of E10 petrol. Owners of the vehicles indicated in this list that are not cleared for the use of E10 should therefore continue to have EU-wide access to today's petrol (EN228: 2008 ) that may contain up to 5% (by volume) ethanol. In addition, it is a general recommendation that fuels containing metallic additives should not be used.

Brand	Models	E10 Guidance
<b>Classic Motorcycles</b>		
	All	Use NON E10 fuel
<b>AJP Motos</b>

### Questions and Answers

- **What about other makes and models not mentioned in the table ?**

Contact the supplying dealer in the first instance. If the dealer is unable to provide information, contact the manufacturer/importer. If neither can help continue to use non E10 while available and prepare to replace incompatible parts in the fuel system (if available).

- **What is my bike was first registered around change over dates from non E10 to E10 compatible production?**

Owners are advised to contact the manufacturer/importer if their motorcycle was first registered within 2/3 years of the change over date of the model year of their bike.

**Example:** If the change over date provided above was the 2000 model year and your bike was registered shortly afterwards, say in 2001 or 2002 you should check with the manufacturer/importer to see if it was pre or post change over production. The manufacturer will need to know the engine and frame numbers.

- **Can I use E10 fuel for my Classic bikes?**

Email [info@mcia.co.uk](mailto:info@mcia.co.uk)

You should continue to use non E10 while available, but prepare to replace parts incompatible parts in the fuel system (on an old Brit bike, typically, carburettor float, float needle and fuel lines).

- **Is E10 compatible with fibre glass tanks and leak preventatives?**

There are already reports of the current petrol which may contain up to 5% ethanol (E5) attacking the resin in fibre glass fuel tanks and some fuel tank leak preventatives. E10 will be even more aggressive.

- **Storage (both E10 and non E10)**

Drain the fuel tank and fuel system.

- **What if I accidentally use the wrong fuel? (E10 in a non E10 compatible bike)**

While in most cases no harm will be done as long as the bike is refilled with non E10 at the next opportunity, because of the possibility of severe damage in isolated cases (e.g. fibre glass tanks, and perhaps other less obvious items) our general advice has to be "drain and refill with non E10".
